# Client

## Server

### client.routes

Associates URLs with respective views so that states may be loaded.

routes references the .html files located in /views

## /views

HTML pages to support each CRUD request and the map display.

#### client.controller

Angular logic for client-side display.

Also manages error handling, and indicating to the user when requests are loading and when they have been completed.

Uses the factory for CRUD requests to the server.

# client.factory

Uses \$http to make CRUD requests via the listings API.

# express

Encapsulates operations in middleware and HTTP requests.

Uses routes to determine what happens for each request.

#### server.routes

Defines server-side responses to various HTTP requests at different URLs.

HTTP requests made by client.factory will be routed according to the router in the express app.

Uses the two controllers to define needed operations upon valid requests.
